
AT32 MCU-based Low Voltage Motor Control Development Board

Overview

This document mainly introduces the basic functions, hardware features and hardware circuits, aimed at helping developers to easily develop motor control applications with AT32 MCU on this board.

1 Board description

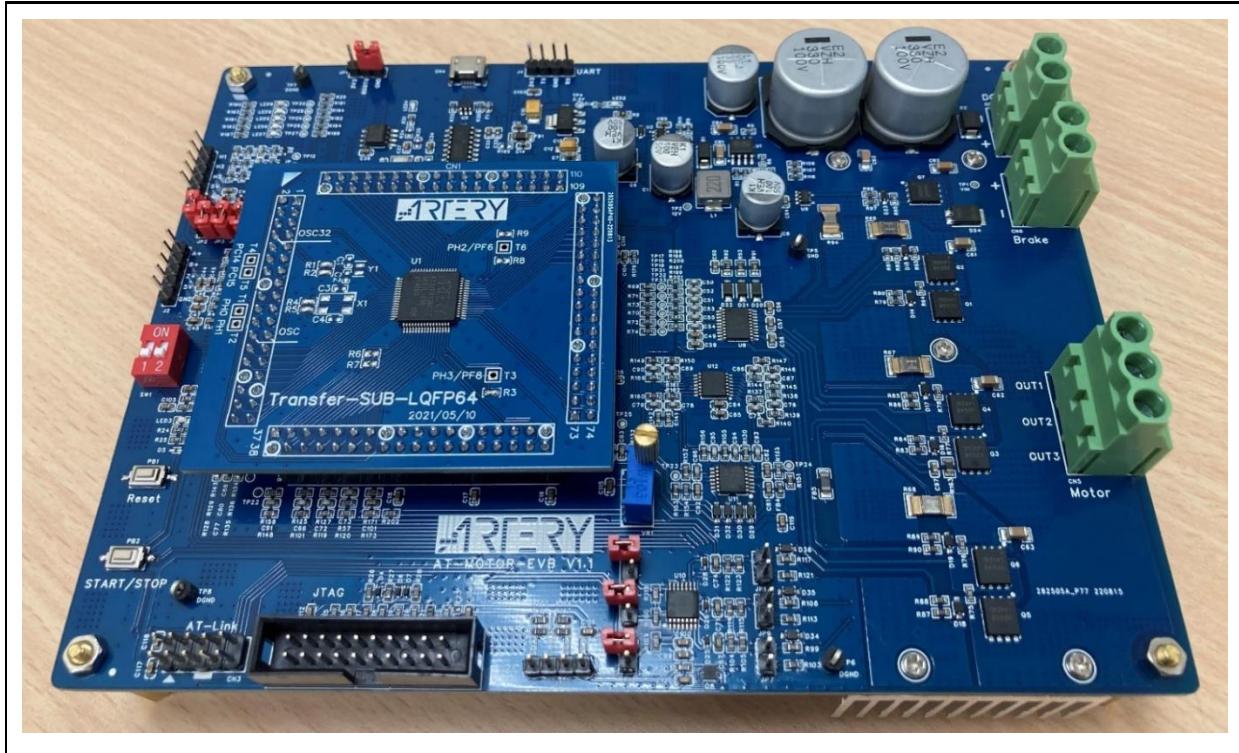

- The motor development board serves as a general-purpose low voltage three-phase motor driver based on ARTERY AT32 MCU and motor control function library. It can be used to drive BLDC, AC synchronous and induction motors.
- A MCU socket applied to all AT32 MCUs for motor control algorithm execution
- Hall connector and encoder connector for rotor position feedback, to drive motor with sensor in FOC vector control or six-step square wave mode
- Brake resistor connector for dynamic braking in high dynamic response control mode
- 3-phase output terminal voltage sensing circuit connected to ADC, virtual neutral point circuit and comparator circuit, suitable for multiple BLDC six-step square wave sensorless applications
- Three phase current sensing resistors and one DC ground bus current sensing resistor, supporting three current sensing modes (3-shunt, 2-shunt and 1-shunt current sensing modes)
- Built-in overcurrent compare circuits for phase currents and bus current
- Support sensored/sensorless field-oriented vector control algorithm to drive three-phase AC motors
- Support household, commercial and industrial motor control application technologies
- Input voltage/output current spec

Input voltage: 12V~60V

Maximum output phase current: 30A_{PEAK}

Overcurrent protection point: 45A_{PEAK}

Figure 1. Low voltage motor control development board

2 Software and hardware requirements

- Windows®-based PC (Windows 8, Windows 10, Windows 11) to install user interface control program
- Micro-B USB cable to connect the board with PC for communication
- ARTERY AT-Link or third-party programmer
- ARTERY AT32 motor control demonstration project program
- 3-phase AC motor with 12V~60V rated voltage and below 30A rated current
- DC power supply

3 Getting started

Rated specifications for motor development board

- Input voltage: 12V~60V
- Maximum output phase current: 30A_{PEAK}
- Overcurrent protection point: 45A_{PEAK}

Get started with the steps below:

- 1) Check that the jumper settings are correct (See Section 4.3)
- 2) Connect AT-Link to CN3, or JTAG to CN2
- 3) Program ARTERY AT32 motor control demonstration program
- 4) Use micro-B USB cable to connect UART-to-USB interface (CN4) to PC USB port
- 5) Connect 3-phase motor cable to CN5, and connect U, V and W wires to OUT1, OUT2 and OUT3, respectively
- 6) Adjust voltage and current if DC power supply, connect output to CN1 before turning on power supply, and then LED1 (12 V power indicator) and LED2 (3.3 V power indicator) will be ON
- 7) Set parameters and control motor operation using the interface control program (ArteryMotorMonitor)

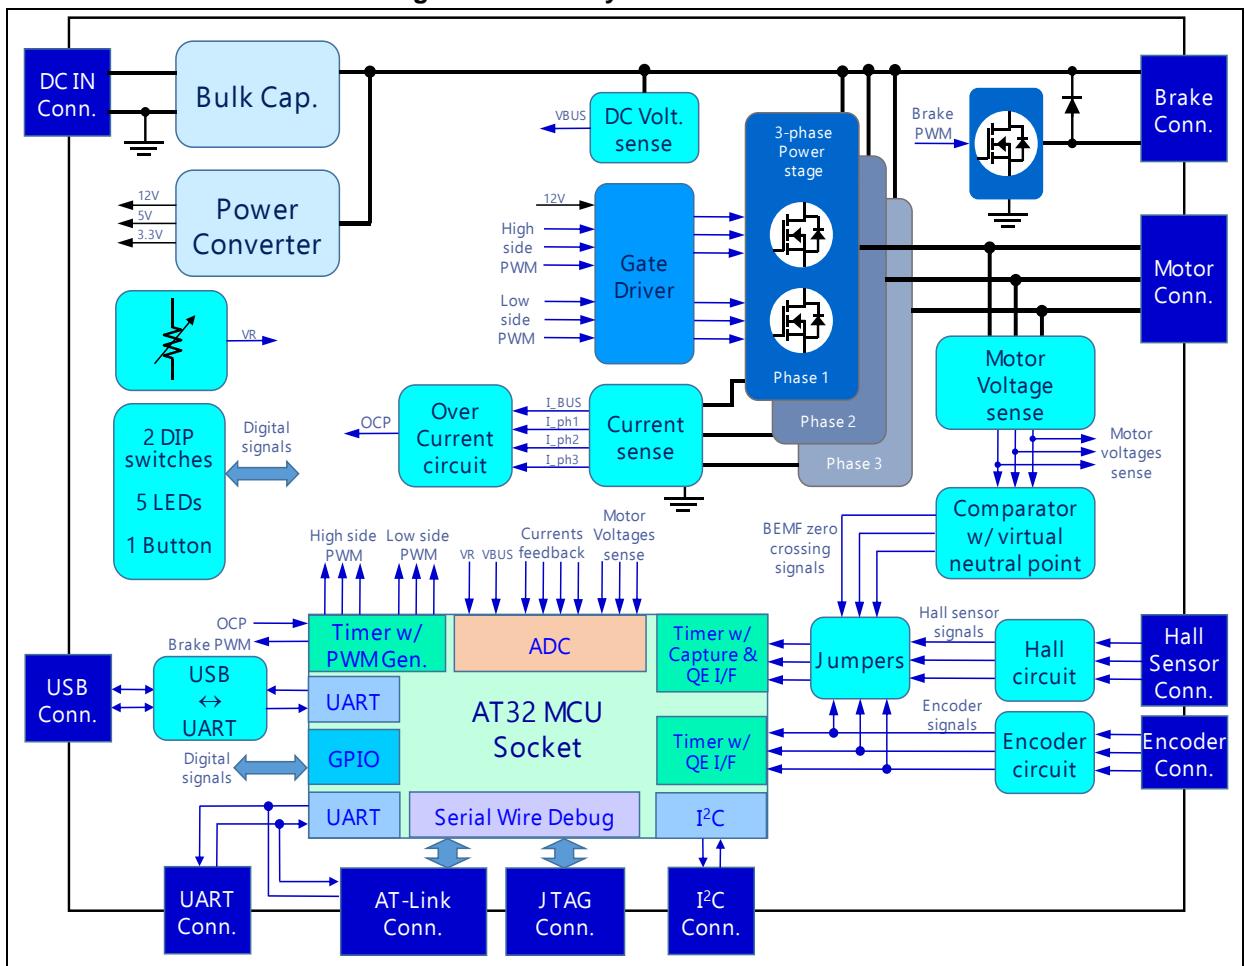

4 Hardware configuration

4.1 System architecture

Figure 2 presents the system architecture of low voltage motor control development board.

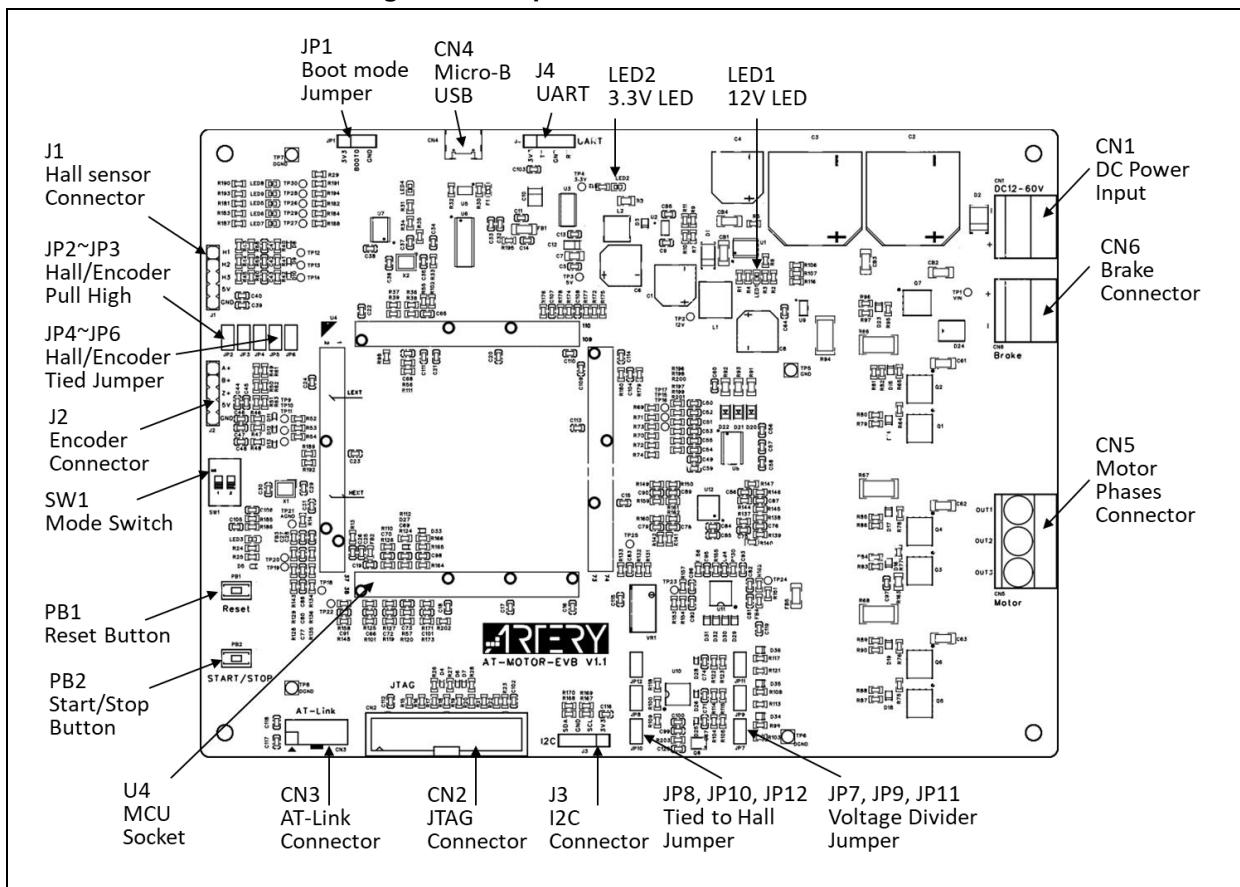

As illustrated in Figure 2, AT32 MCU socket is available to be connected with most AT32 MCUs. The MCU PWM generator is used to control three-phase full-bridge circuit and brake circuit. The output of 3-phase power stage has a voltage divider circuit for 3-phase output voltages feedback. The board also includes a comparator circuit with virtual neutral point, which is able to feedback the zero crossing signals of BLDC BEMF. Besides, there are on-board Hall sensor and encoder connectors designed to feedback rotor positions. In terms of command input interfaces, the board incorporates USB-to-USART, UART, I²C, and a potentiometer analog input interface. By adjusting this potentiometer to change the output voltage command and read by ADC. In addition, the board offers two DIP switches and one button switch that can be used to configure control modes. Also, five LEDs including an error LED are available on the board.

4.3 Jumper settings

Table 1. Jumper settings

Jumper No.	Description	Pre-configured state
JP1	Connect Boot0 to either VCC(1-2) or GND(2-3)	2-3
JP2	Connect Hall sensor signal to VCC pull-up resistor	CLOSED
JP3	Connect Encoder signal to VCC pull-up resistor	OPEN
JP4	Connect Encoder A signal to Hall signal H1 on MCU side	OPEN
JP5	Connect Encoder B signal to Hall signal H2 on MCU side	OPEN
JP6	Connect Encoder Z signal to Hall signal H3 on MCU side	OPEN
JP7	This is used to connect BEMF1 voltage divider resistors in parallel to reduce the divider value.	OPEN
JP8	Connect BEMF1 compare signal output to Hall signal H1 on MCU side	OPEN
JP9	This is used to connect BEMF2 voltage divider resistors in parallel to reduce the divider value.	OPEN
JP10	Connect BEMF2 compare signal output to Hall signal H2 on MCU side	OPEN
JP11	This is used to connect BEMF3 voltage divider resistors in parallel to reduce the divider value.	OPEN
JP12	Connect BEMF3 compare signal output to Hall signal H3 on MCU side	OPEN

4.4 Connectors

4.4.1 CN1

CN1 is DC power supply input, in the range of 12V~60V.

Table 2. CN1 description

Pin	Symbol	Description
1	-	Negative power input
2	+	Positive power input

4.4.2 CN2

CN2 is a 20-pin JTAG connector that can be used for programming and debugging through third-party programmers.

Table 3. CN2 (JTAG) description

Pin	Description	Pin	Description
1	Volt Target ref	2	Volt supply
3	nTRST	4	GND
5	TDI	6	GND
7	TMS (SWDIO)	8	GND
9	TCK (SWCLK)	10	GND
11	RTCK	12	GND
13	TDO (SWO)	14	GND
15	nSRST	16	GND
17	NC	18	GND
19	NC	20	GND

4.4.3 CN3

CN3 is a 10-pin AT-Link connector that can be used for programming and debugging through ARTERY's AT-Link tool.

Table 4. CN3 (AT-Link) description

Pin	Description	Pin	Description
1	3.3V supply	2	5.0V supply
3	TMS (SWDIO)	4	BOOT0
5	TCK (SWCLK)	6	TDO (SWO)
7	TMS (SWDIO)	8	UART_RX
9	RESET	10	UART_TX

4.4.4 CN4

CN4 is a Micro-B connector. It is used for serial communication between the on-board UART-to-USB circuit and external USB interface.

Table 5. CN4 (USB) description

Pin	Description	Pin	Description
1	5V	2	D-
3	D+	4	ID
5	GND		

4.4.5 CN5

CN5 serves as a connector linking the board to the motor three-phase power lines.

Table 6. CN5 description

Pin	Symbol	Description
1	OUT1	Motor phase U connection
2	OUT2	Motor phase V connection
3	OUT3	Motor phase W connection

4.4.6 CN6

CN6 connector is used to connect the board to a brake resistor. The selection of the value of the brake resistor should take into consideration the applied voltage in order to make sure that the maximum brake current is below 40A. For example, for a 40V DC power (applied voltage), the value of the resistor must be greater than $1\ \Omega$.

Table 7. CN6 description

Pin	Symbol	Description
1	+	Brake interface on power supply side
2	-	Brake interface on transistor side

	2	B+	Incremental encoder phase B signal pin
	3	Z+	Incremental encoder phase Z signal pin
	4	5V	Incremental encoder 5V power pin
	5	GND	Incremental encoder power ground
J3	1	3V3	I2C 3.3V power ground
	2	SCL	I2C SCL signal pin
	3	GND	I2C power ground
	4	SDA	I2C SDA signal pin

Connector	Pin	Symbol	Description
J4	1	3V3	UART 3.3V power pin
	2	TX	UART TX signal pin
	3	GND	UART power ground
	4	RX	UART RX signal pin

4.5 Test points

Table 9. Summary of test points

Test point No.	Description
TP1	Input voltage
TP2	12V voltage
TP3	5V voltage
TP4	3.3V voltage
TP5	GND
TP6,TP7,TP8	DGND digital ground
TP9	Encoder A+ signal
TP10	Encoder B+ signal
TP11	Encoder Z+ signal
TP12	Hall sensor H1 signal
TP13	Hall sensor H2 signal
TP14	Hall sensor H3 signal
TP15	PWM2H signal
TP16	PWM3H signal
TP17	PWM1H signal
TP18	Feedback signal of the 2 nd phase current after going through current sensing resistor and being amplified
TP19	Feedback signal of the 3 rd phase current after going through current sensing resistor and being amplified
TP20	Feedback signal of the 1 st phase current after going through current sensing resistor and being amplified
TP21	AGND analog ground
TP22	Feedback signal of DC bus current after going through current sensing resistor and being amplified
TP23	Overcurrent setpoint voltage of DC bus current
TP24	Overcurrent setpoint voltage of phase current
TP25	Overcurrent emergency stop protection BKIN signal

Test point No.	Description
TP26	LED1 status indicator
TP27	LED3 status indicator
TP28	Digital output test point signal
TP29	LED2 status indicator
TP30	LED error status indicator
TP31	PWM1L signal
TP32	PWM2L signal
TP33	PWM3L signal

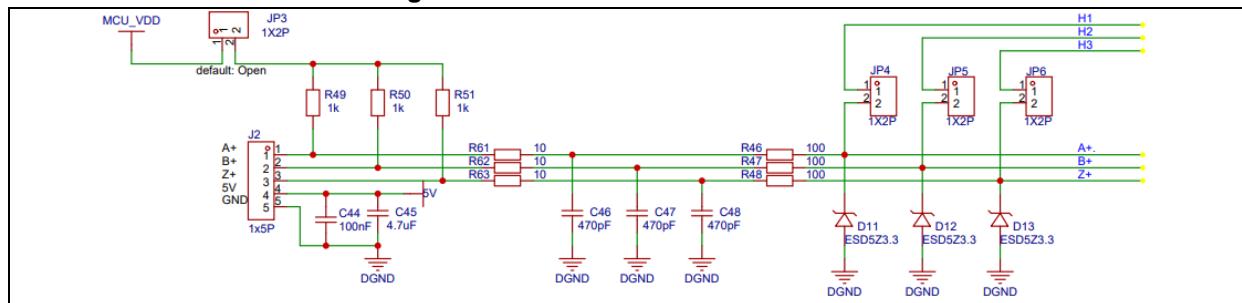

5 Hardware circuit

- Contains a three-phase full-bridge power stage circuit that can drive three-phase motors, and includes a brake resistor circuit that can consume regenerative power by applying an external resistor;
- Designed with two buck converters: one steps down the input DC voltage to 12 V to provide gate driver chip control voltage, and the other one converts 12 V to 5 V to provide power for the Hall sensor and incremental encoder; with a LDO circuit that provides 3.3 V working power;
- Provides input interface of incremental encoder and Hall sensor, which can be used to feedback rotor position;
- Designed with three current sensing resistors and circuit to feedback three-phase current, and one current sensing resistor on DC bus to feedback bus current, which can be used to realize single-shunt current sensing control;
- The aforementioned current sensing feedback circuits contain OCP (overcurrent protection) circuits, and connect the output to MCU to shutdown PWM output and realize the overcurrent protection mechanism;
- Contains three-phase terminal voltage divider circuit and its feedback signals are connected to MCU ADC pins, virtual neutral point circuit and phase voltage polarity judgment circuit. They can be used in six-step square-wave sensorless control mode;
- Contains a DC input voltage divider circuit that is used for sensing DC bus voltage, and a temperature sensing circuit composed of a NTC (negative temperature coefficient) resistor to feedback MOSFET temperature;
- Contains a RESET button, a USER button, two custom DIP switches, four status LEDs and one error LED;
- Designed with one potentiometer circuit that is connected to MCU ADC pin and can be customized by the user;
- Provides a serial-Micro-B USB interface for the convenience of communication with external devices, and one USB power LED;
- Provides one I2C interface and one UART serial interface;
- Designed with AT-Link connector and the JTAG connector for a 3rd-party programmer.

5.1 Incremental encoder circuit

As shown in Figure 4, for the open-drain encoder, JP3 can be short-connected to connect the input pin to a $1k\Omega$ pull-up resistor, and the input signal is connected to MCU through an RC low-pass filter composed of 10Ω resistor and $470pF$ capacitor. If the applied MCU does not have the corresponding peripheral pins of the circuit, the output signal can be connected to Hall sensor circuit output end through JP4 ~ JP6 jumpers and use another timer peripherals of MCU.

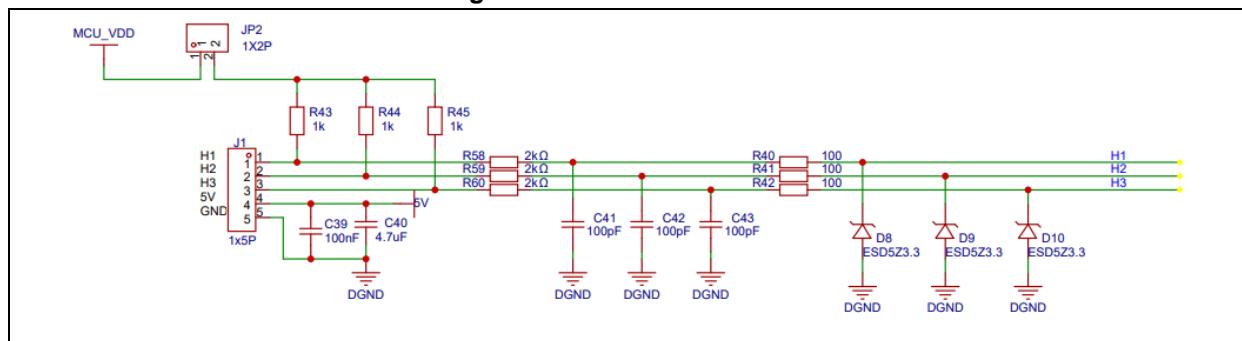

Figure 4. Incremental encoder circuit

5.2 Hall sensor circuit

As shown in Figure 5, the Hall sensor is generally open-drain type, so that JP2 jumper is short-connected by default and connects the input pin to a $1k\Omega$ pull-up resistor. The input signal is connected to MCU through an RC low-pass filter composed of $2k\Omega$ resistor and $100pF$ capacitor.

Figure 5. Hall sensor circuit

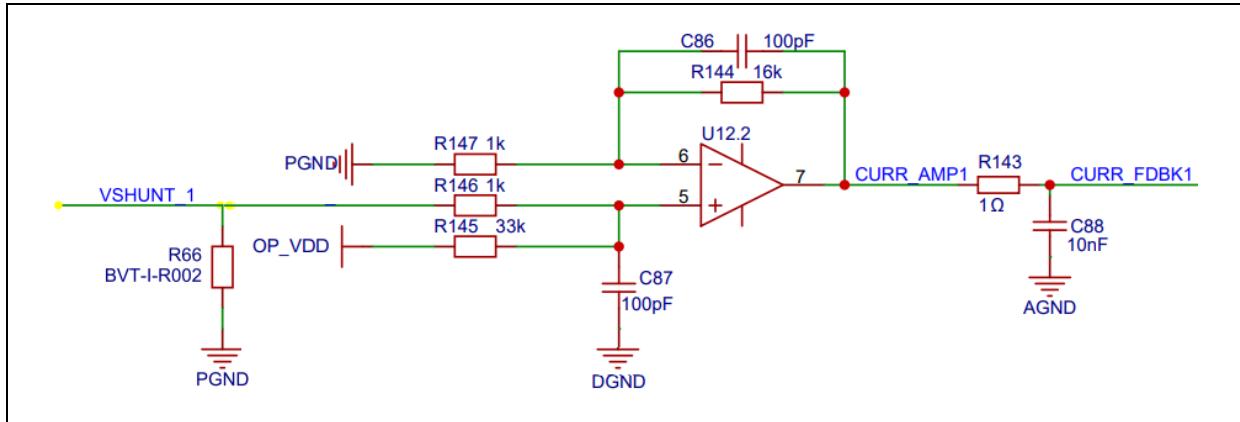

5.3 Current sensing circuit

5.3.1 Phase current sensing circuit

As shown in Figure 6, the phase current passes through a $2\text{m}\Omega$ current sensing resistor, and then it is amplified 16.5 times by an amplifying circuit, and the output DC voltage level is also pulled up to 1.65 V; therefore, the maximum current sensing range is $\pm 50\text{A}_{\text{PEAK}}$.

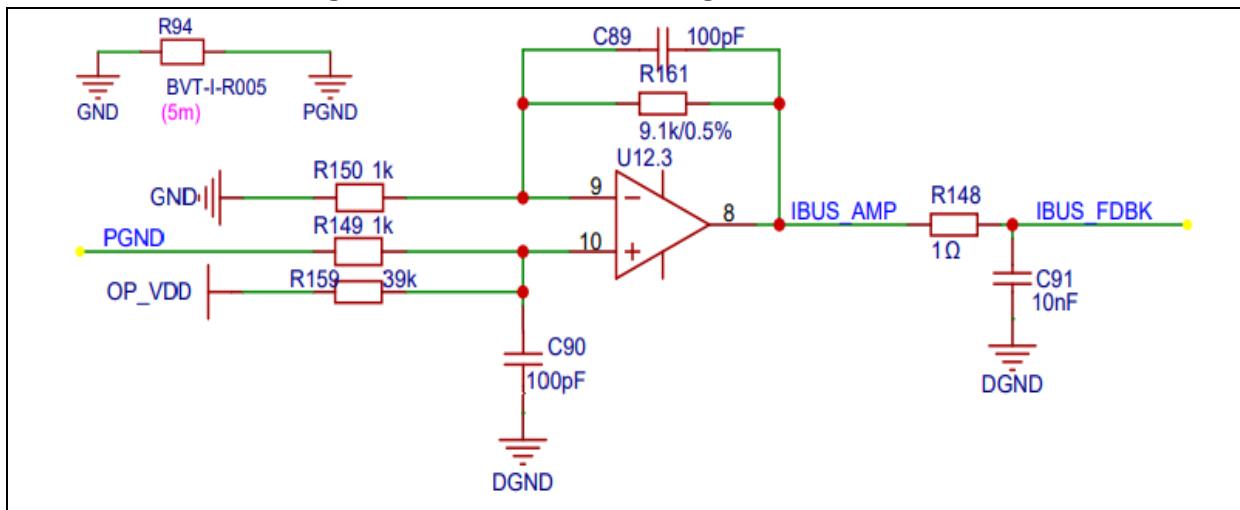

Figure 6. Phase current sensing feedback circuit

5.3.2 DC bus current sensing circuit

As shown in Figure 7, the bus current passes through a $5\text{ m}\Omega$ current sensing resistor, and then it is amplified 9.85 times by an amplifying circuit, and the output DC voltage level is also pulled up to 0.833 V; therefore, the maximum current sensing range is $-16.9\text{A}_{\text{PEAK}}$ to $50.1\text{A}_{\text{PEAK}}$.

Figure 7. DC bus current sensing feedback circuit

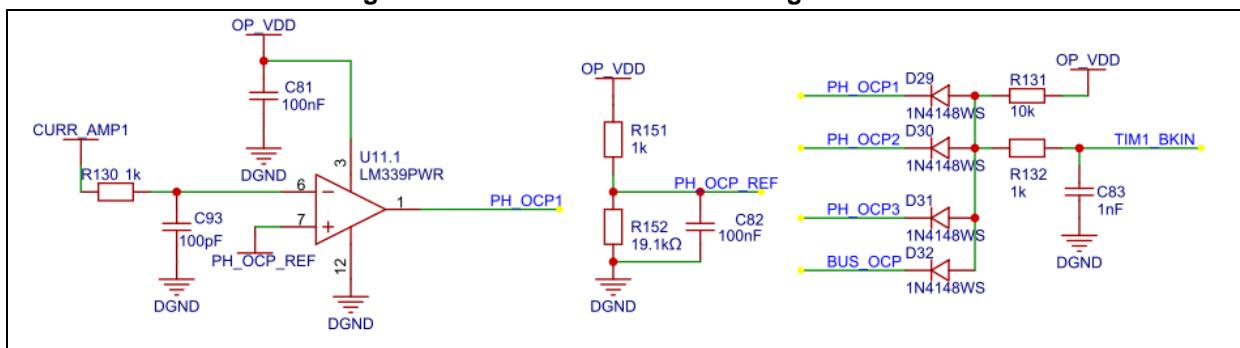

5.4 OCP sensing circuit

5.4.1 Three-phase OCP sensing circuit

The three-phase OCP sensing circuit consists of three comparator circuits (one-phase protection circuit is shown in Figure 8), and the three-phase OCP circuit contains one overcurrent reference level divider circuit. The protection circuit compares the amplified three-phase current feedback signal with the overcurrent reference voltage. If the feedback signal is higher than the reference voltage, the comparator outputs low level, and connects to the MCU timer BKIN pin to stop PWM output. Based on the voltage division level as shown in the figure below, the overcurrent protection point of phase current is $45A_{PEAK}$.

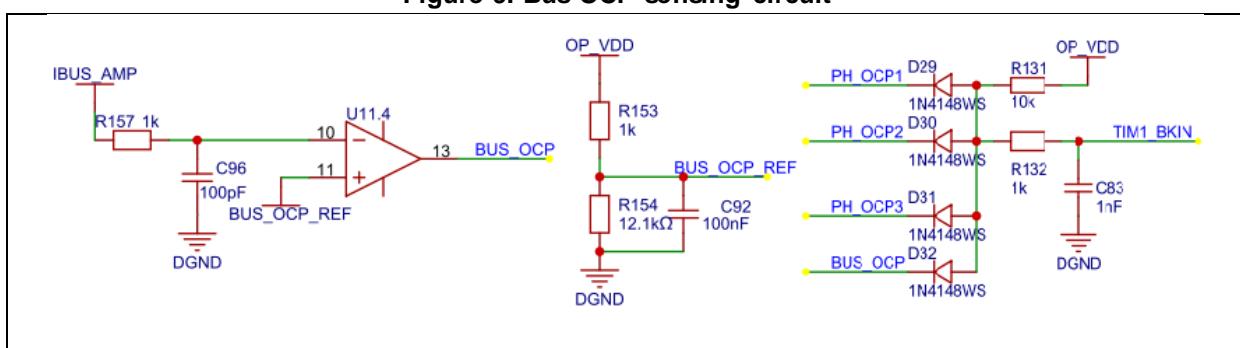

Figure 8. Phase current OCP sensing circuit

5.4.2 Bus OCP sensing circuit

The bus overcurrent sensing circuit is composed of a comparator, and its OCP sensing circuit is shown in Figure 9, which contains an overcurrent reference level divider circuit. The OCP circuit compares the amplified bus current feedback signal with the overcurrent reference voltage. If the feedback signal is higher than the reference voltage, the comparator outputs low level, and connects to MCU timer BKIN pin to stop PWM output. Based on the voltage division level as shown in the figure below, the overcurrent protection point of phase current is $45A_{PEAK}$.

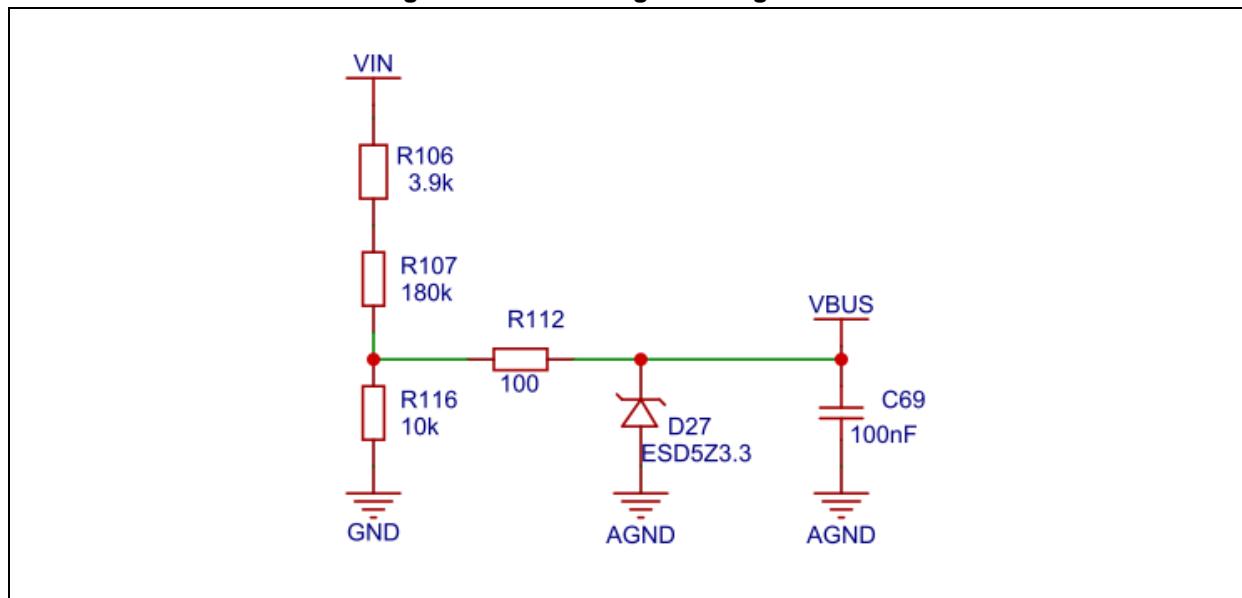

Figure 9. Bus OCP sensing circuit

5.5 Bus voltage sensing circuit

The bus voltage sensing circuit is composed of a divider circuit as shown in Figure 10. The maximum voltage value that can be measured by the circuit is 64 V, and the overvoltage/undervoltage protection function can be realized according to the bus voltage feedback. Calculating with three-phase PWM duty cycles, the driver output voltage can be estimated, which can be used to estimate the BEMF in sensorless control.

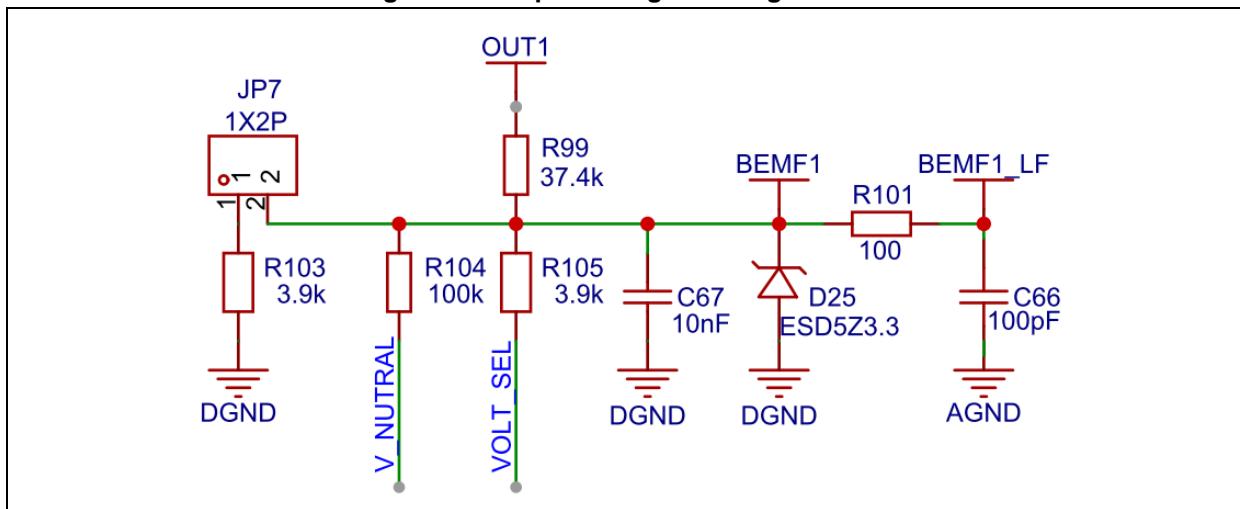

Figure 10. Bus voltage sensing circuit

5.6 Three-phase output voltage sensing circuit

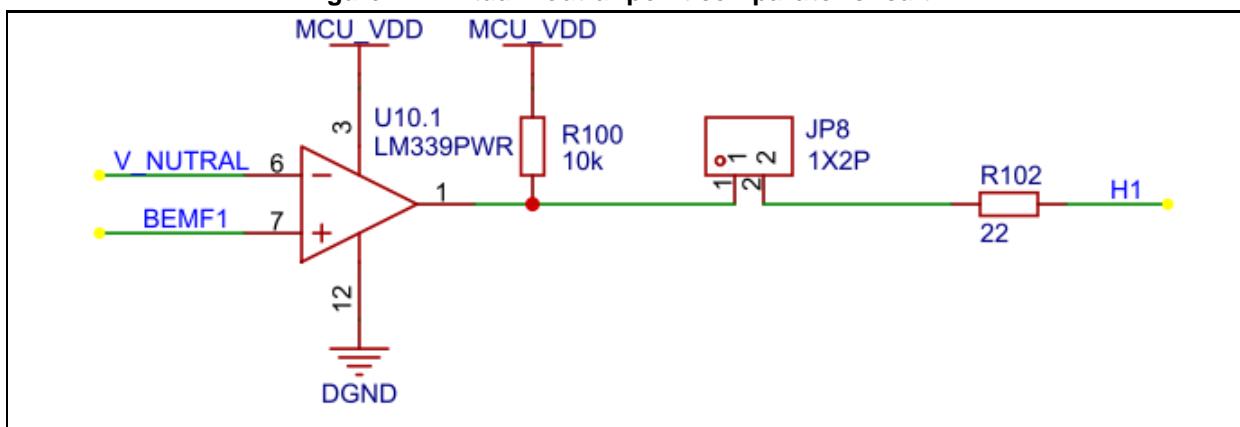

One of the three-phase output voltage sensing circuit is shown in Figure 11, which passes through a low-pass RC filter and connects to MCU ADC input pin. In sine wave driving mode, it can feedback the motor terminal voltage, and then integrate with the feedback currents to estimate the motor three-phase BEMF. In case of six-step square-wave drive control, it can be used to measure the BEMF zero crossing point of open phase. Based on the PWM duty cycle, it is possible to measure the zero crossing point during PWM OFF or PWM ON. If the PWM duty cycle is low, measure the zero crossing point in PWM OFF; otherwise, measure in PWM ON. The filter capacitor after voltage division can be changed or removed according to the actual demand.

Figure 11. Output voltage sensing circuit

In addition to measuring open-phase zero crossing point in ADC manner, a virtual neutral point comparator circuit (as shown in Figure 12) is also provided by the evaluation board. Connect the voltage signals after three-phase voltage division through three $100\text{ k}\Omega$ resistors to get a virtual neutral point signal; then the comparator compares the three-phase terminal voltages with the virtual neutral point signal, so as to judge the BEMF zero-crossing point according to the comparator output level. As shown in the figure below, short the jumper to connect comparator signal to MCU Hall sensor pin.

Figure 12. Virtual neutral point comparator circuit

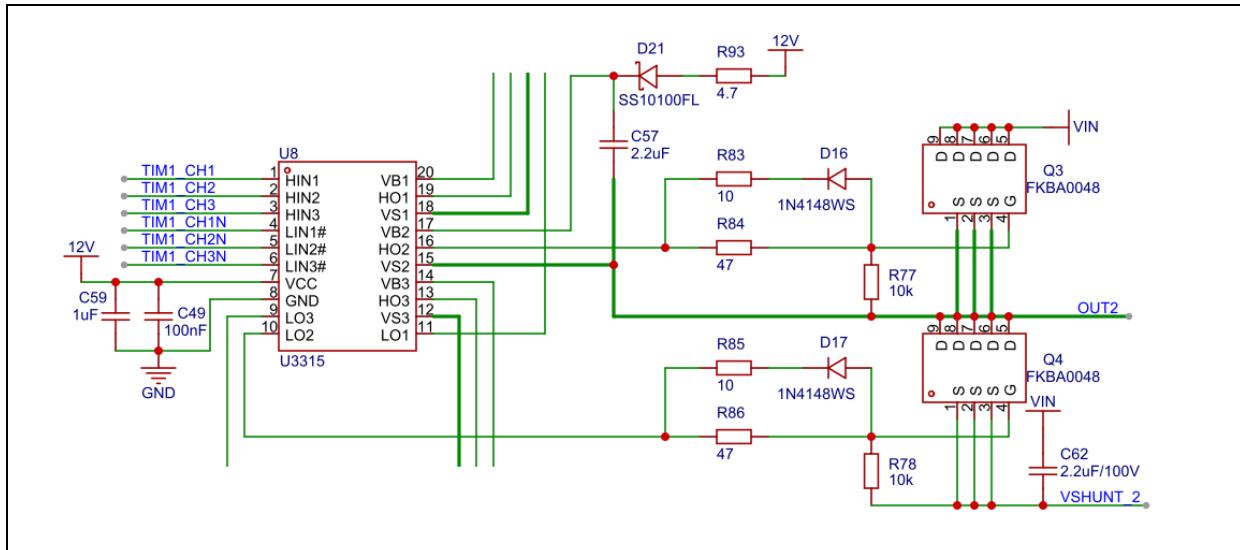

5.7 Power stage circuit

5.7.1 Three-phase full-bridge converter circuit

The three-phase full-bridge converter circuit is composed of an integrated three-phase full-bridge gate driver chip, six 100V/78A/8mΩ MOSFETs (package: DFN5×6-8) and relevant circuits. Figure 13 shows the phase V half-bridge power conversion circuit, where OUT2 is connected to phase V output of CN5 connector to connect the motor phase V wire. The Q4 MOSFET source output V_SHUNT2 passes through the current sensing resistor to feedback phase V current.

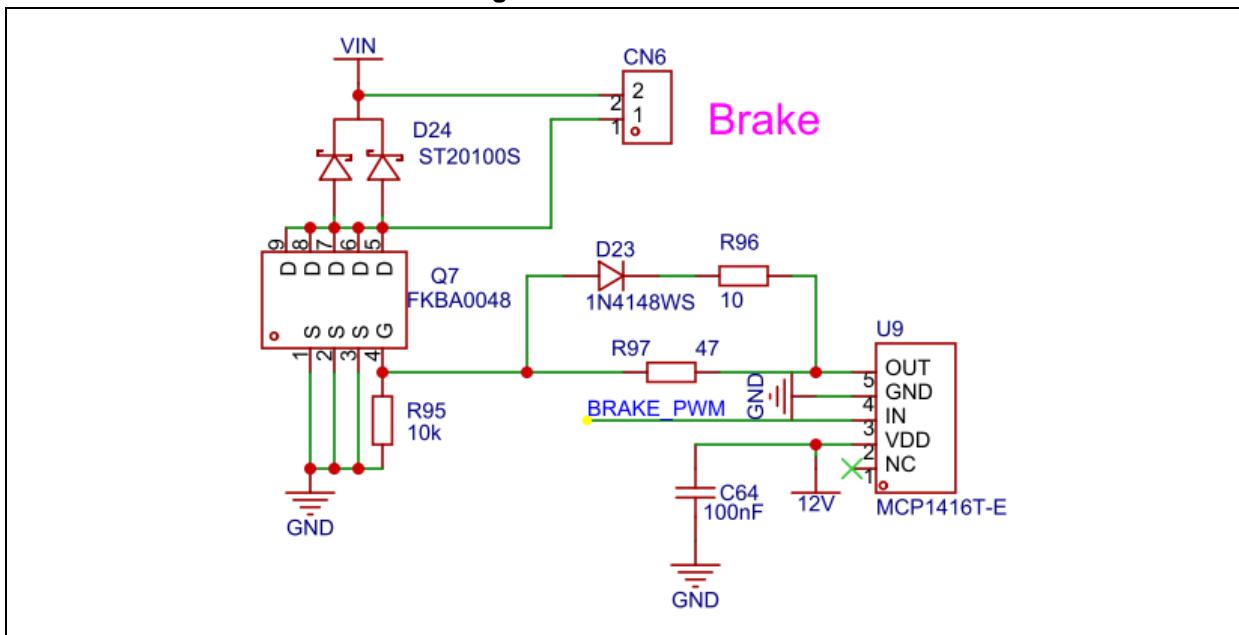

Figure 13. V-shunt half-bridge power conversion circuit

5.7.2 Brake circuit

The brake circuit is shown in Figure 14. CN6 is connected to an external brake resistor, and the driving signal drives Q7 MOSFET via U9 gate driver, so as to connect the brake resistor across the DC bus to dissipate motor regenerative energy. Note that a proper brake resistor should be used to ensure that the maximum current is below 40 A. For example, if the bus voltage is 60 V, the brake resistor should not be less than 1.5 Ω.

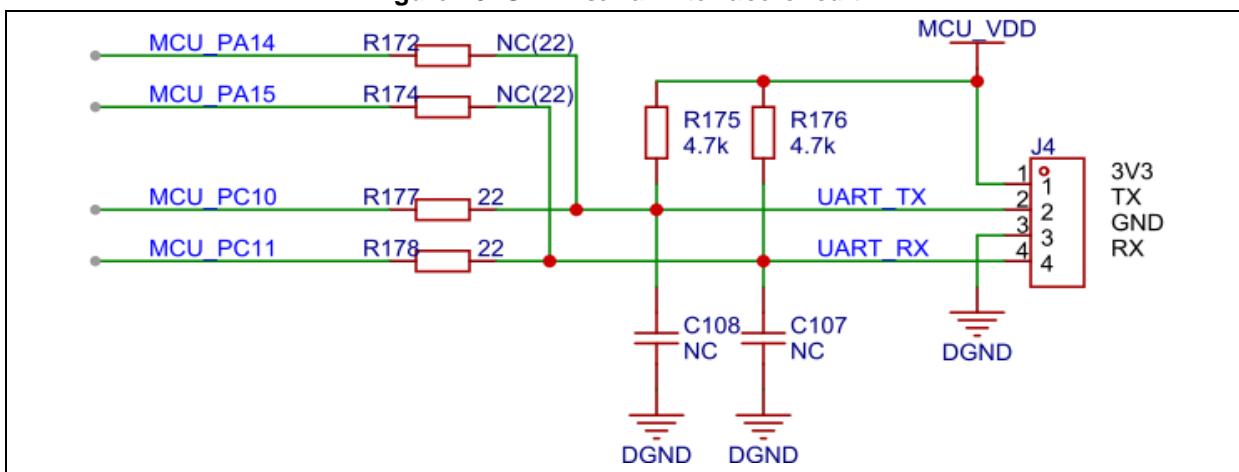

Figure 14. Brake circuit

5.8 Communication circuit

The evaluation board has one serial-Micro-B USB interface, one I²C interface and one UART serial interface. The signal pins of UART serial interface can be adjusted for different MCUs, as shown in Figure 15.

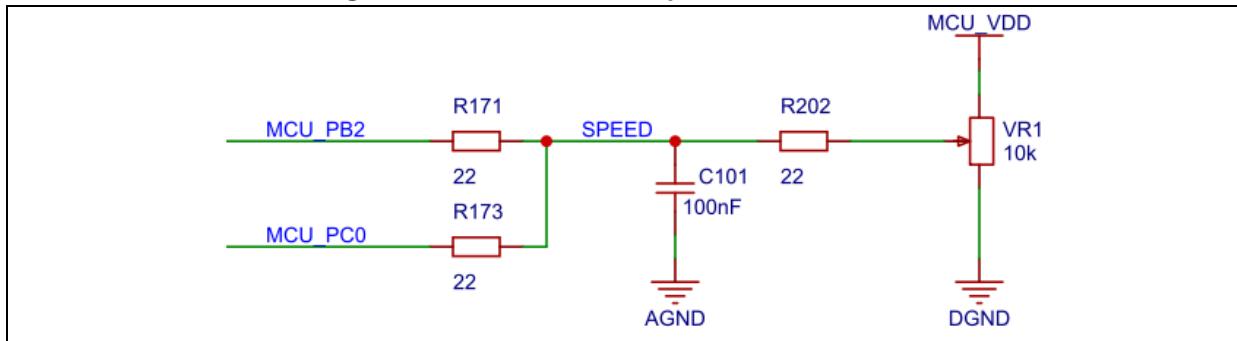

Figure 15. UART serial interface circuit

5.9 Potentiometer input interface

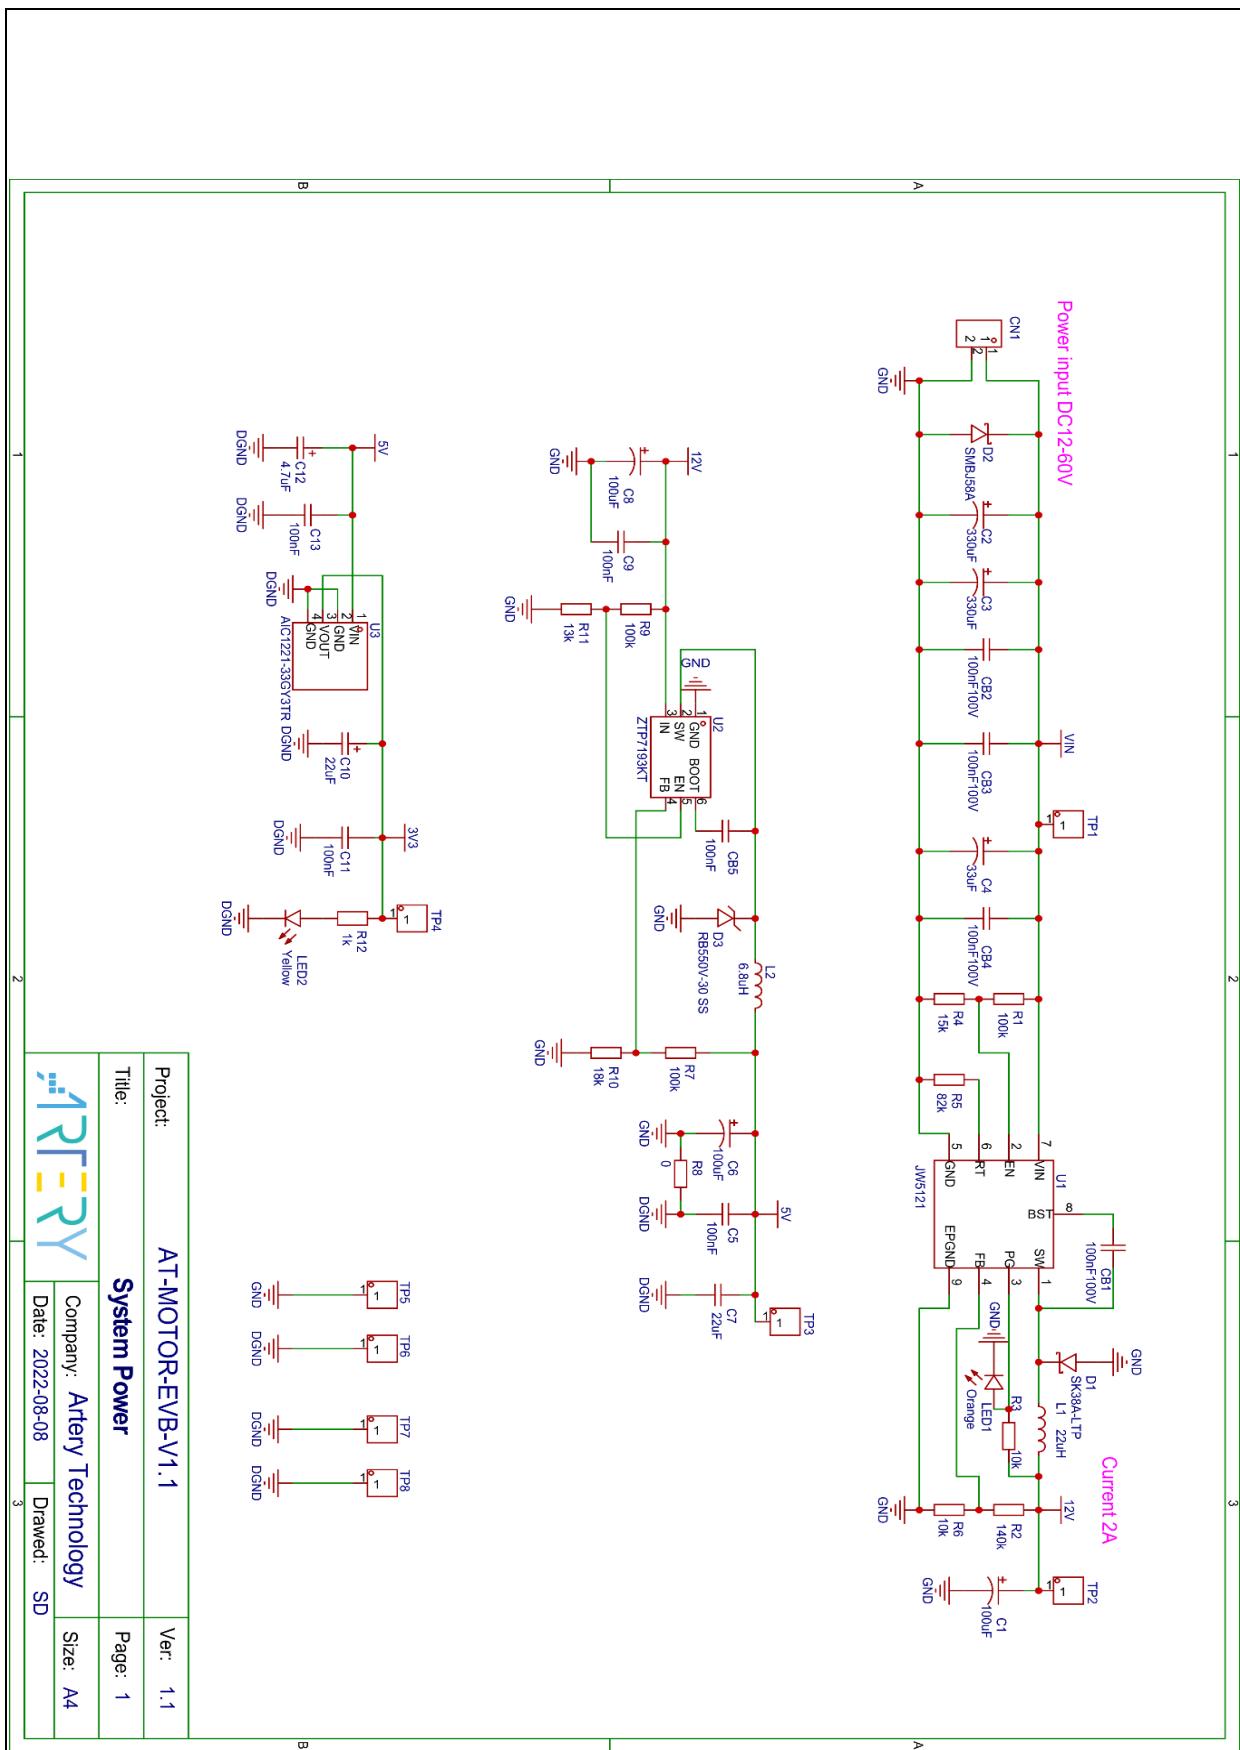

This circuit contains a 30-turn 10 kΩ potentiometer that can be connected to MCU ADC pins according to different MCUs. The potentiometer input interface circuit is shown in Figure 16 below.

9 Revision history

Table 10. Document revision history

Date	Version	Revision note
2022.11.18	2.0.0	Initial release.
2022.11.23	2.0.1	Modified some of the descriptions.
2022.12.01	2.0.2	Modified some of the terminologies.

IMPORTANT NOTICE – PLEASE READ CAREFULLY

Purchasers are solely responsible for the selection and use of ARTERY's products and services; ARTERY assumes no liability for purchasers' selection or use of the products and the relevant services.

No license, express or implied, to any intellectual property right is granted by ARTERY herein regardless of the existence of any previous representation in any form. If any part of this document involves third party's products or services, it does NOT imply that ARTERY authorizes the use of the third party's products or services, or permits any of the intellectual property, or guarantees any uses of the third party's products or services or intellectual property in any way.

Except as provided in ARTERY's terms and conditions of sale for such products, ARTERY disclaims any express or implied warranty, relating to use and/or sale of the products, including but not restricted to liability or warranties relating to merchantability, fitness for a particular purpose (based on the corresponding legal situation in any unjudicial districts), or infringement of any patent, copyright, or other intellectual property right.

ARTERY's products are not designed for the following purposes, and thus not intended for the following uses: (A) Applications that have specific requirements on safety, for example: life-support applications, active implant devices, or systems that have specific requirements on product function safety; (B) Aviation applications; (C) Aerospace applications or environment; (D) Weapons, and/or (E) Other applications that may cause injuries, deaths or property damages. Since ARTERY products are not intended for the above-mentioned purposes, if purchasers apply ARTERY products to these purposes, purchasers are solely responsible for any consequences or risks caused, even if any written notice is sent to ARTERY by purchasers; in addition, purchasers are solely responsible for the compliance with all statutory and regulatory requirements regarding these uses.

Any inconsistency of the sold ARTERY products with the statement and/or technical features specification described in this document will immediately cause the invalidity of any warranty granted by ARTERY products or services stated in this document by ARTERY, and ARTERY disclaims any responsibility in any form.
